1. 2-Spring Nozzle & Nozzle Holder Service Manual

1-1. Outline

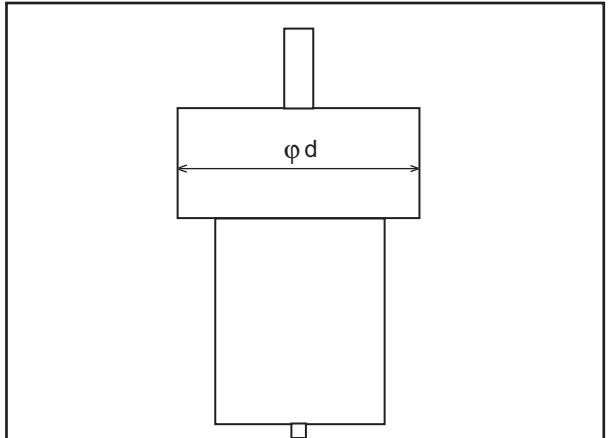

- This manual describes the 2-spring nozzles and nozzle holders and explains their repair and adjustment methods by citing their representative models as examples. While the nozzles that are currently used can be broadly divided into two types, there are four types of adjustment methods. Thus, for an effective operation, refer to this manual before performing a repair.

1-2. Models and Types of 2-spring Nozzles and Nozzle Holders

Nozzle holder model	Nozzle model	Construction	Type
KBL, KBAL	DLL-P	Capsule type (conventional type)	1
		Shim adjustment (reinforced type)	2
	DLL-S	Shim adjustment (conventional type)	3
		Shim adjustment (reinforced type)	4

A. Differences in nozzle models

Nozzles come in size P, R, S, T, U, V, or W, which designates the outer diameter dimension of the collar portion of the nozzle body. For most automotive applications, nozzles sized P or S are used.

Size symbol	φd (mm)	
P	14.3	
R	16	
S	17	
T	22	
U	30	
V	42	
W	50	
		 PS0002E

< NOTE >

- To adjust the pre-lift, the conventional type uses a pre-lift adjustment shim and the reinforced type uses a pre-lift adjustment spring seat.

1-3. Adjustment Method and Applicable Engine Model by Construction Type

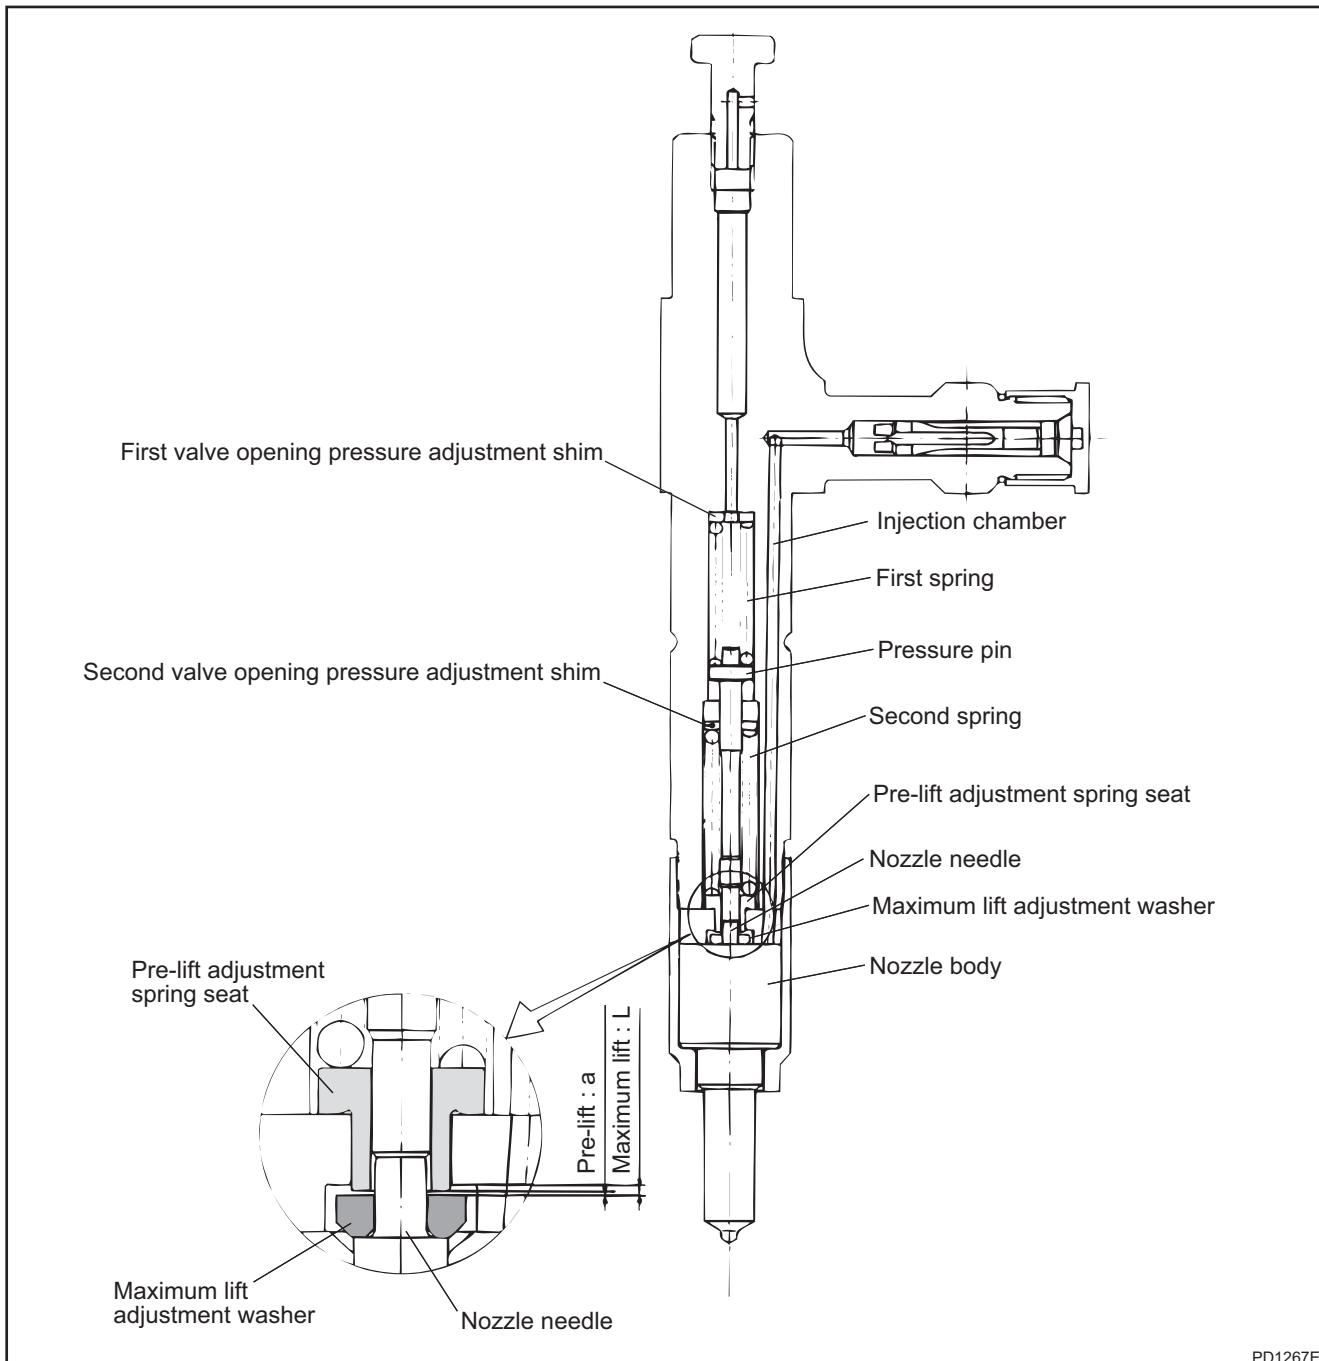

Type	Construction	Representative engine model	Manufacturer
1	Capsule type (conventional type)	1Z, 1HD-T	TOYOTA
		4D32, 4D33, 4D33-2, 4D35	mitsubishi
2	Shim adjustment (reinforced type)	1HD-FT, 15B-F, 15B-FT	TOYOTA
		4D33-4, 4D34T4, 4D35, 4M5# series	mitsubishi
3	Shim adjustment (conventional type)	EF500, EK100, EM100, M10U, H07C, H06C-TE	HINO
		8DC, 8DC10, 8DC11	mitsubishi
4	Shim adjustment (reinforced type)	F17D, F17D-T, F17E, EM100, M10C, H07C-T, J-1, JT-1, JT-2, FT-1	HINO
		6D16T6	mitsubishi
		H07B-T	YAMAHA

1-4. STT Application

No.	Part Name	DENSO P/N	Type 1	Type 2	Type 3	Type 4
1	2-spring nozzle adjustment tool	95091-10770			O	
2	2-spring tool set	95093-00040	O			
2-1	2-spring base	95093-10230	O	O		O
2-2	2-spring box	95093-10250	O			
2-3	Measure attachment	95093-10300	O	O

7	Probe	95800-20030				O
8	Socket wrench	95991-10150				O
2-spring tool set is composed of 2-1, 2-2, 2-3, 2-4 and 2-5.						

1-5. Construction

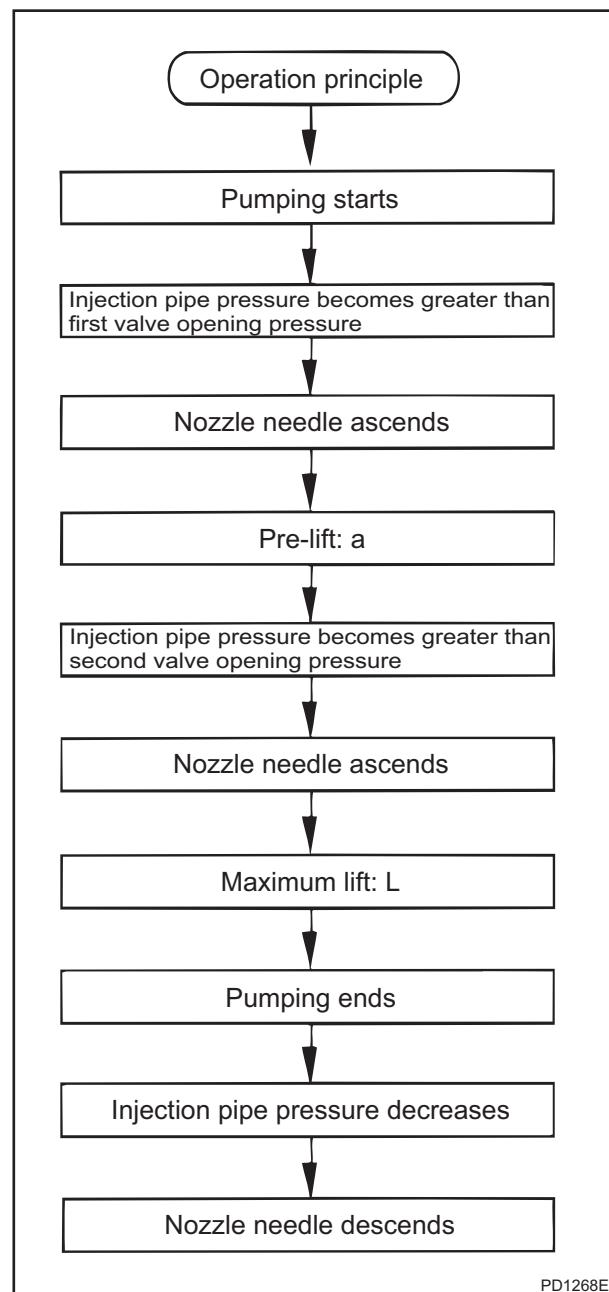

- A 2-spring nozzle holder contains two springs to enable the nozzle needle to be lifted in two stages in accordance with the pressure in the injection pipe. To show its construction, an example of a nozzle and nozzle holder (type II, reinforced) used on the 1HD-FT engine is given below. Although there are some differences in construction and operation by type, they are all identical in principle.

1-6. Operation

A. Operation Principle

- a. The sequence of operations from the time the fuel is pumped until the injection is completed is indicated below:
- The high-pressure fuel that has been pumped by the injection pump travels via the injection pipe and enters the nozzle body.
 - The injection pipe pressure rises, becomes greater than the first valve opening pressure (the force of the first spring), and lifts the nozzle needle.
 - Pushed by the nozzle needle, the maximum lift adjustment washer rises only for the amount of "pre-lift: a", and upon coming in contact with the pre-lift adjustment spring seat, the nozzle needle stops momentarily.
 - The injection pipe pressure rises further, becomes greater than the second valve opening pressure (the resultant force of the first and second springs), and lifts the nozzle needle further.
 - Pushed by the nozzle needle, the maximum lift adjustment washer and the pressure pin ascend only for the amount of "maximum lift: L", and the nozzle needle comes to a stop.
 - The pumping of fuel ends and the injection pipe pressure becomes lower than the second opening valve pressure (the resultant force of the first and second springs).
 - Pushed by the second spring, the pre-lift adjustment spring seat, the maximum lift adjustment washer, and the nozzle needle are pushed further by the first spring. As a result, the pressure pin and the nozzle needle descend, thus completing the injection.

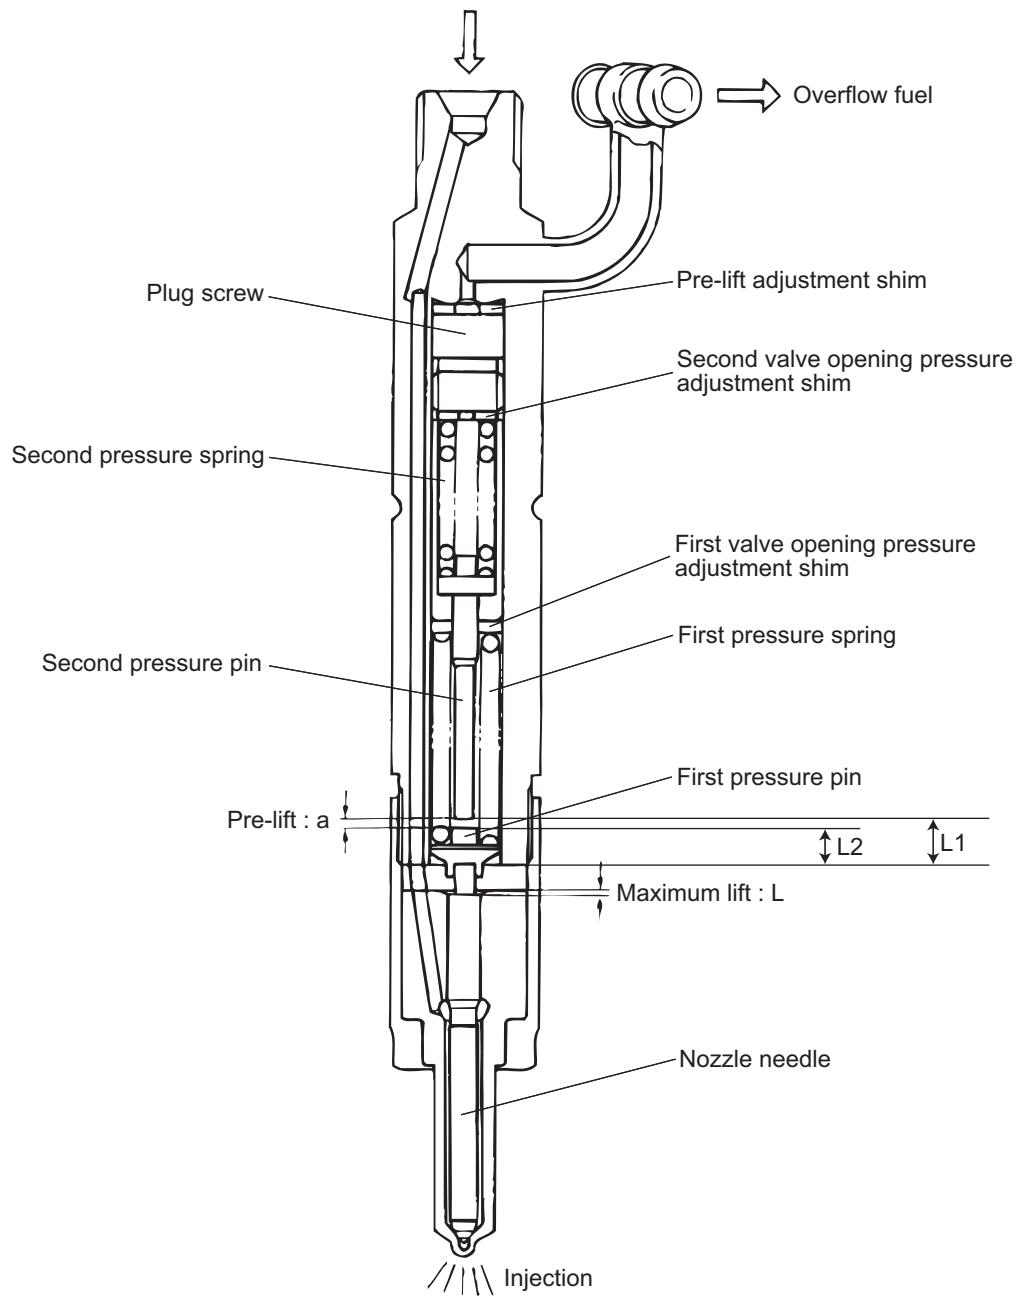

PD1268E

- b. The sequence of operations described above can be explained more simply as follows:
- It is the first spring that determines the first valve opening pressure. To adjust this pressure, the first valve opening pressure adjustment shim is used to change the set load of the first spring.
 - To adjust the amount of pre-lift, the pre-lift adjustment spring seat is used.
 - It is the resultant force of the first and second springs that determines the second valve opening pressure. To adjust this pressure, the second valve opening pressure adjustment shim is used to change the set load of the second spring.
 - The amount of maximum lift is adjusted by using the maximum lift adjustment washer.

1-7. Adjustment Procedure by Type

c. Adjustment Procedure (Summary)

Adjustment Sequence	1. Pre-lift	2. Second Valve Opening Pressure	3. First Valve Opening Pressure
Measurement Method	Measure "L1 - L2", the difference between the holder dimension L1 and the nozzle dimension L2.	Pull out the first pressure spring and the first valve opening pressure adjustment shim, loosen the plug screw one to two turns, and measure the valve opening pressure.	Assemble parts other than the hollow screw and measure the valve opening pressure.
Adjustment Method	Select a pre-lift adjustment shim (the thicker the shim, the smaller the pre-lift will be).	Select a second valve opening pressure adjustment shim (the thicker the shim, the higher the valve opening pressure will be).	Select a first valve opening pressure adjustment shim (the thicker the shim, the higher the valve opening pressure will be).
Tools	2-spring tool set (STT: 95093-00040) Dial gauge	Nozzle hand tester	Nozzle hand tester

d. STT

No.	Part Name	DENSO P/N	
0	2-spring tool set	95093-00040

2	Measure attachment	95093-10300	
3	2-spring box	95093-10250	
4	Straight pin	95904-10070	
5	Dial gauge	95800-10050	

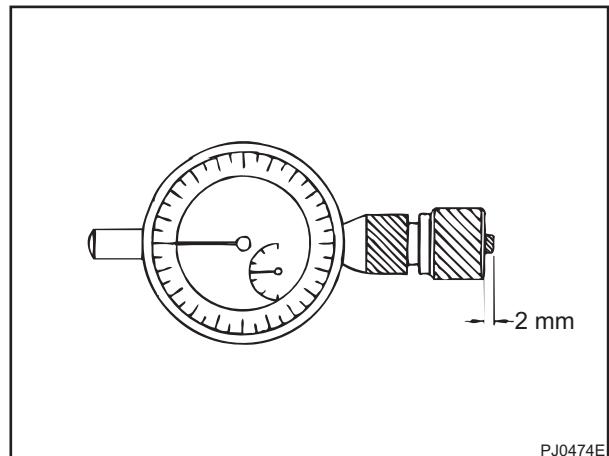

PJ0472E

e. Detailed Adjustment Procedure (For 093500-4491 as an example)

(1) Pre-lift adjustment

A) Adjustment 1

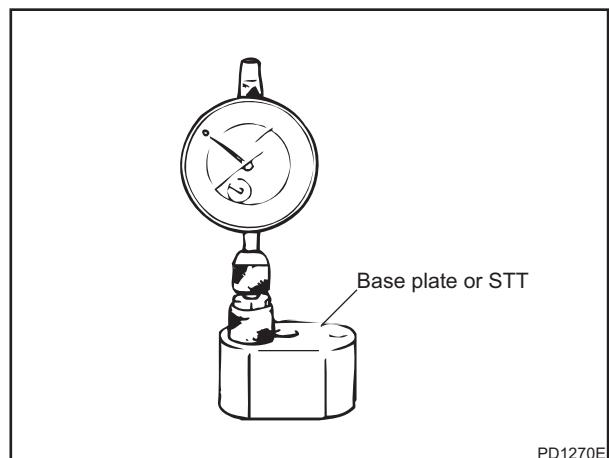

Assemble the STT on the dial gauge so that the distance between the probe and the end of the STT is 2mm or less.

PJ0474E

B) Adjustment 2

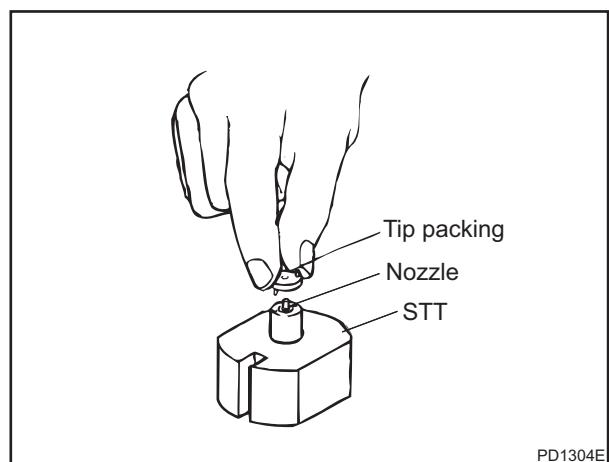

On a base plate or STT, set the dial gauge graduation to zero.

PD1270E

C) Adjustment 3

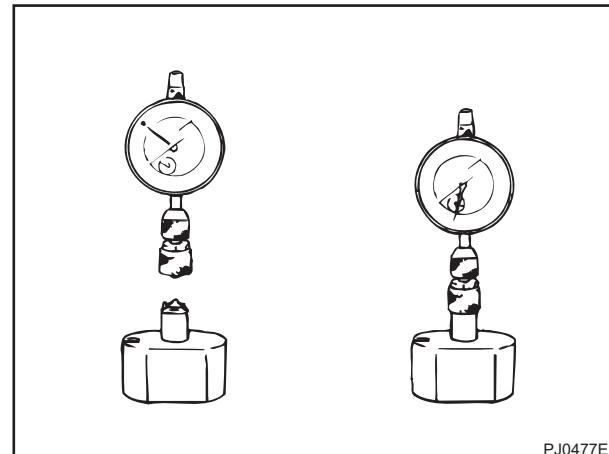

Assemble the nozzle, tip packing, and straight pin on the STT, and install the first pressure pin.

PD1304E

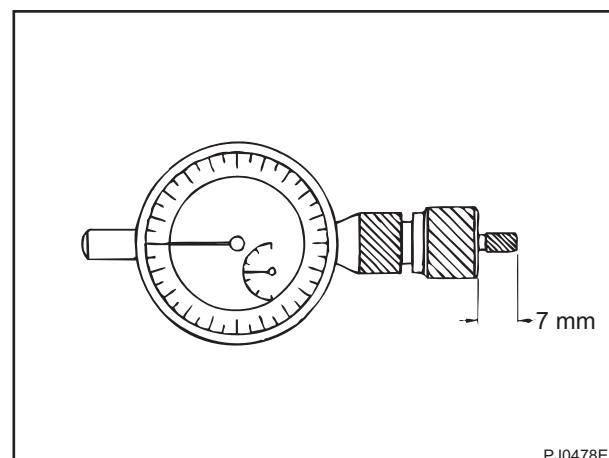

D) Adjustment 4

Align the hole of the STT with the straight pin and measure the dimension L2.

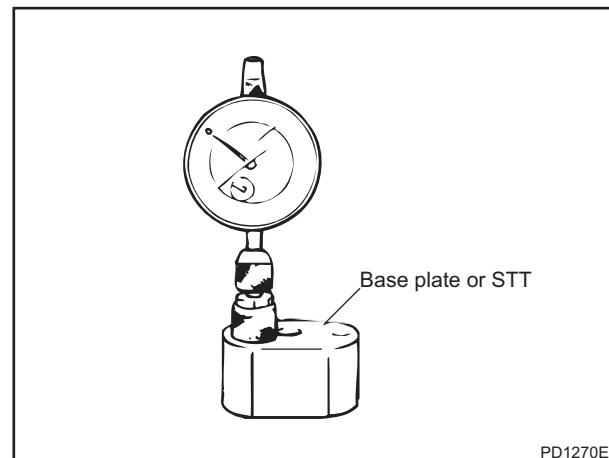

E) Adjustment 5

Assemble the STT on the dial gauge so that the distance between the probe and the end of the STT is 7mm or more.

F) Adjustment 6

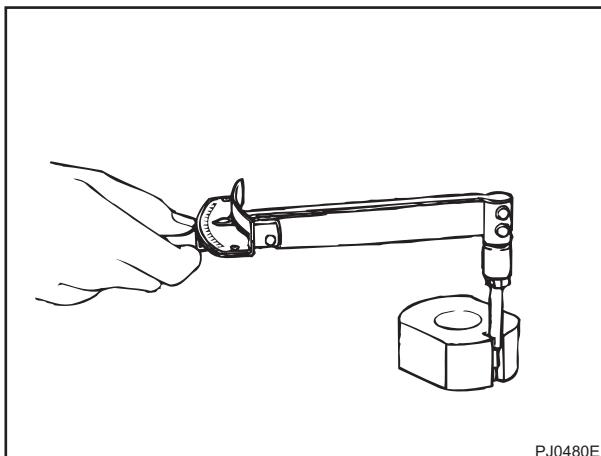

On a base plate or STT, set the dial gauge graduation to zero.

G) Adjustment 7

Assemble the capsule sub-assembly. Assemble the second pressure pin, the second pressure spring, and the second valve opening pressure adjustment shim on the capsule screw, and use the STT to tighten the plug screw.

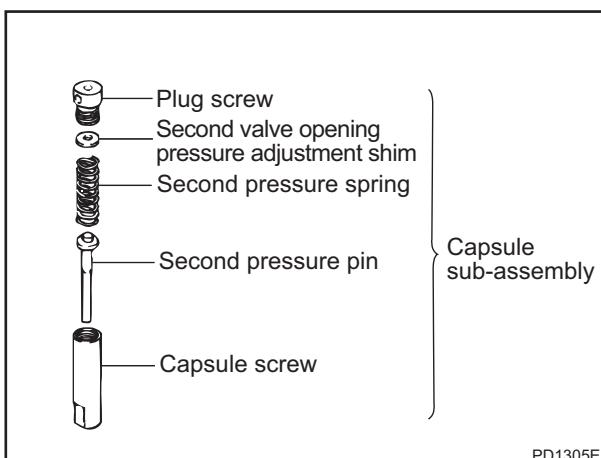

- Tightening torque: 2.0 - 2.9N·m (0.2 - 0.3kgf·m)

PJ0480E

< NOTE >

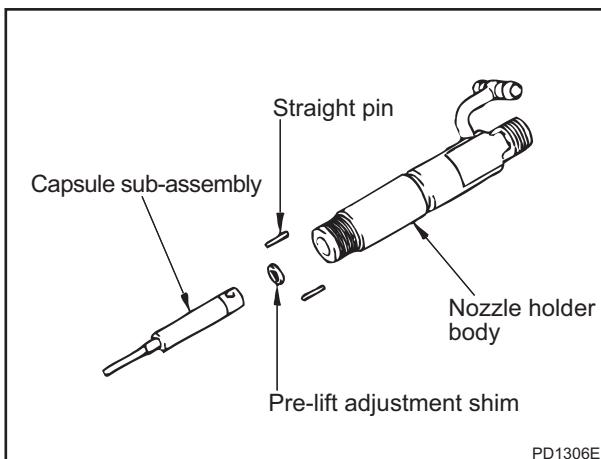

- If the thickness of the second valve opening pressure adjustment shim is unknown, use 1.5mm as a nominal value.

PD1305E

H) Adjustment 8

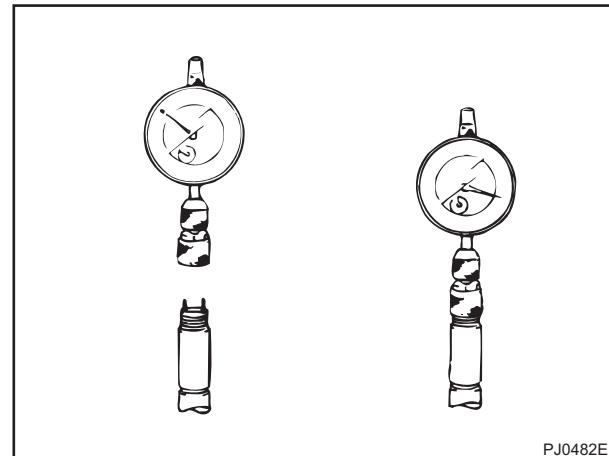

Assemble the pre-lift adjustment shim, the capsule sub-assembly, and the straight pin in the nozzle holder body.

PD1306E

I) Adjustment 9

Alight the straight pin with the hole of the STT and measure the dimension L1.

J) Adjustment 10

Using dimensions L1 and L2 obtained in steps "Adjustment 4" and "Adjustment 9", calculate the amount of pre-lift a.

- Pre-lift a = L1 - L2
- Pre-lift a (specified value) = $0.08 \pm 0.02\text{mm}$

K) Adjustment 11

If the amount of pre-lift deviates from the specified value, adjust it by changing the pre-lift adjustment shim to one with a different thickness.

< NOTE >

- The thicker the pre-lift adjustment shim, the smaller the pre-lift will be.

< CAUTION >

- Because adjusting the pre-lift requires high precision, thoroughly clean the parts and make sure that they are free of foreign objects before performing the operation.

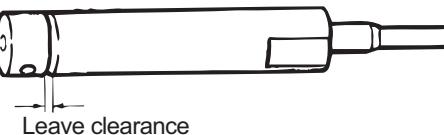

(2) Second valve opening pressure adjustment

A) Adjustment 1

Loosen the plug screw of the capsule sub-assembly one to two turns.

< NOTE >

- After the plug screw has been loosened one to two turns, the amount of pre-lift will be 0mm when it is installed in the nozzle holder.

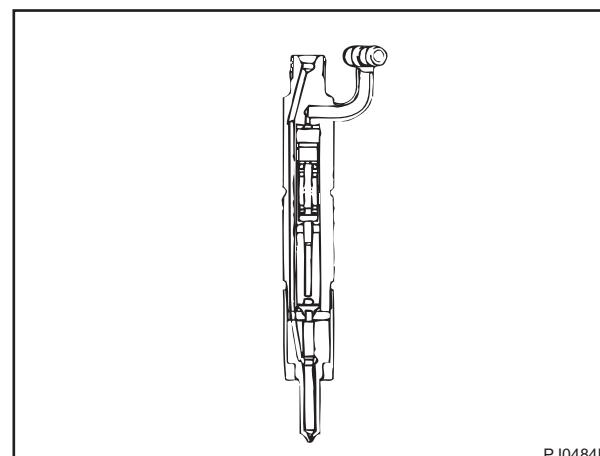

PD1307E

B) Adjustment 2

In the nozzle holder body, install the pre-lift adjustment shim that was selected in section "(1)", the capsule sub-assembly in the state described in "Adjustment 1", the first pressure pin, tip packing, straight pin, and the nozzle. Then, tighten the retaining nut.

< NOTE >

- At this time, do not install the first pressure spring and the first valve opening pressure adjustment shim.
- Tightening torque: 24.5 - 34.3N·m (2.5 - 3.5kgf·m)

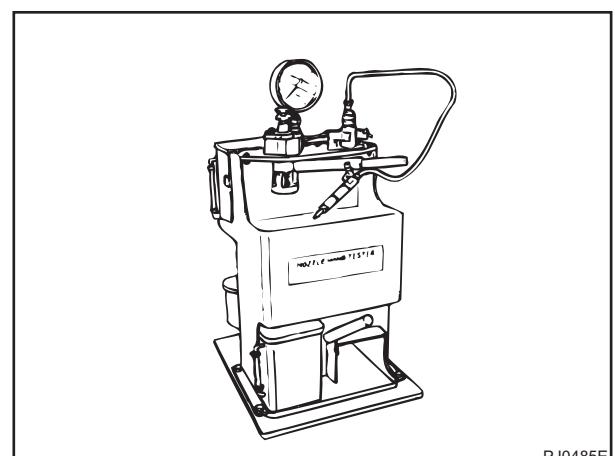

PJ0484E

C) Adjustment 3

On the nozzle hand tester, install the nozzle and the nozzle holder that were installed in "Adjustment 2", and measure the valve opening pressure.

- Second valve opening pressure (specified value):
13.5 - 14.5MPa (138 - 148kgf/cm²)

PJ0485E

D) Adjustment 4

If the pressure deviates from the specified value, adjust it by changing the second valve opening pressure adjustment shim to one with a different thickness.

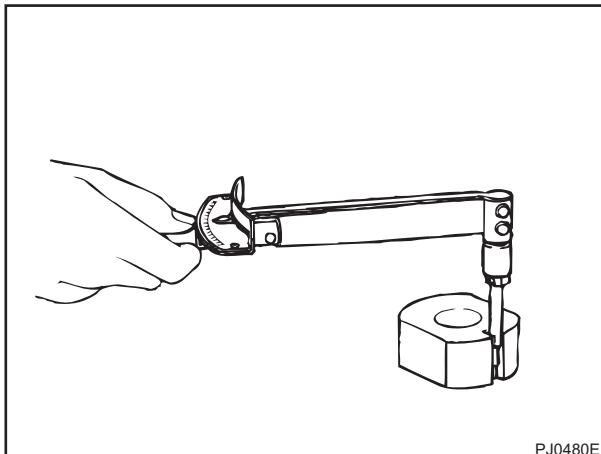

< CAUTION >

- Make sure to loosen the plug screw one to two turns before assembling the capsule sub-assembly by changing the second valve opening pressure adjustment shim.

E) Adjustment 5

After completing the second valve opening pressure adjustment, remove the capsule sub-assembly from the nozzle and nozzle holder. Then, use the STT to tighten the plug screw.

- Tightening torque: 2.0 - 2.9N·m (0.2 - 0.3kgf·m)

PJ0480E

(3) First valve opening pressure adjustment

A) Adjustment 1

In the nozzle holder body, install the pre-lift adjustment shim that was selected in section "(1)", the capsule sub-assembly that was adjusted in section "(2)", the first valve opening pressure adjustment shim, the first pressure spring, the first pressure pin, the tip packing, the straight pin, and the nozzle. Then, tighten the retaining nut.

- Tightening torque: 24.5 - 34.3N·m (2.5 - 3.5kgf·m)

< NOTE >

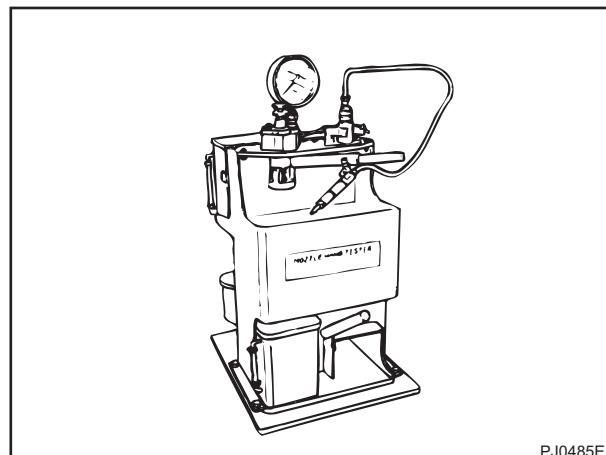

- If the thickness of the first valve opening pressure adjustment shim is unknown, use 1.5mm as a nominal value.

B) Adjustment 2

On the nozzle hand tester, attach the nozzle and the nozzle holder that were installed in "Adjustment 1", and adjust the valve opening pressure.

- First valve opening pressure:

16.2 - 17.2MPa (165 - 175kgf/cm²)

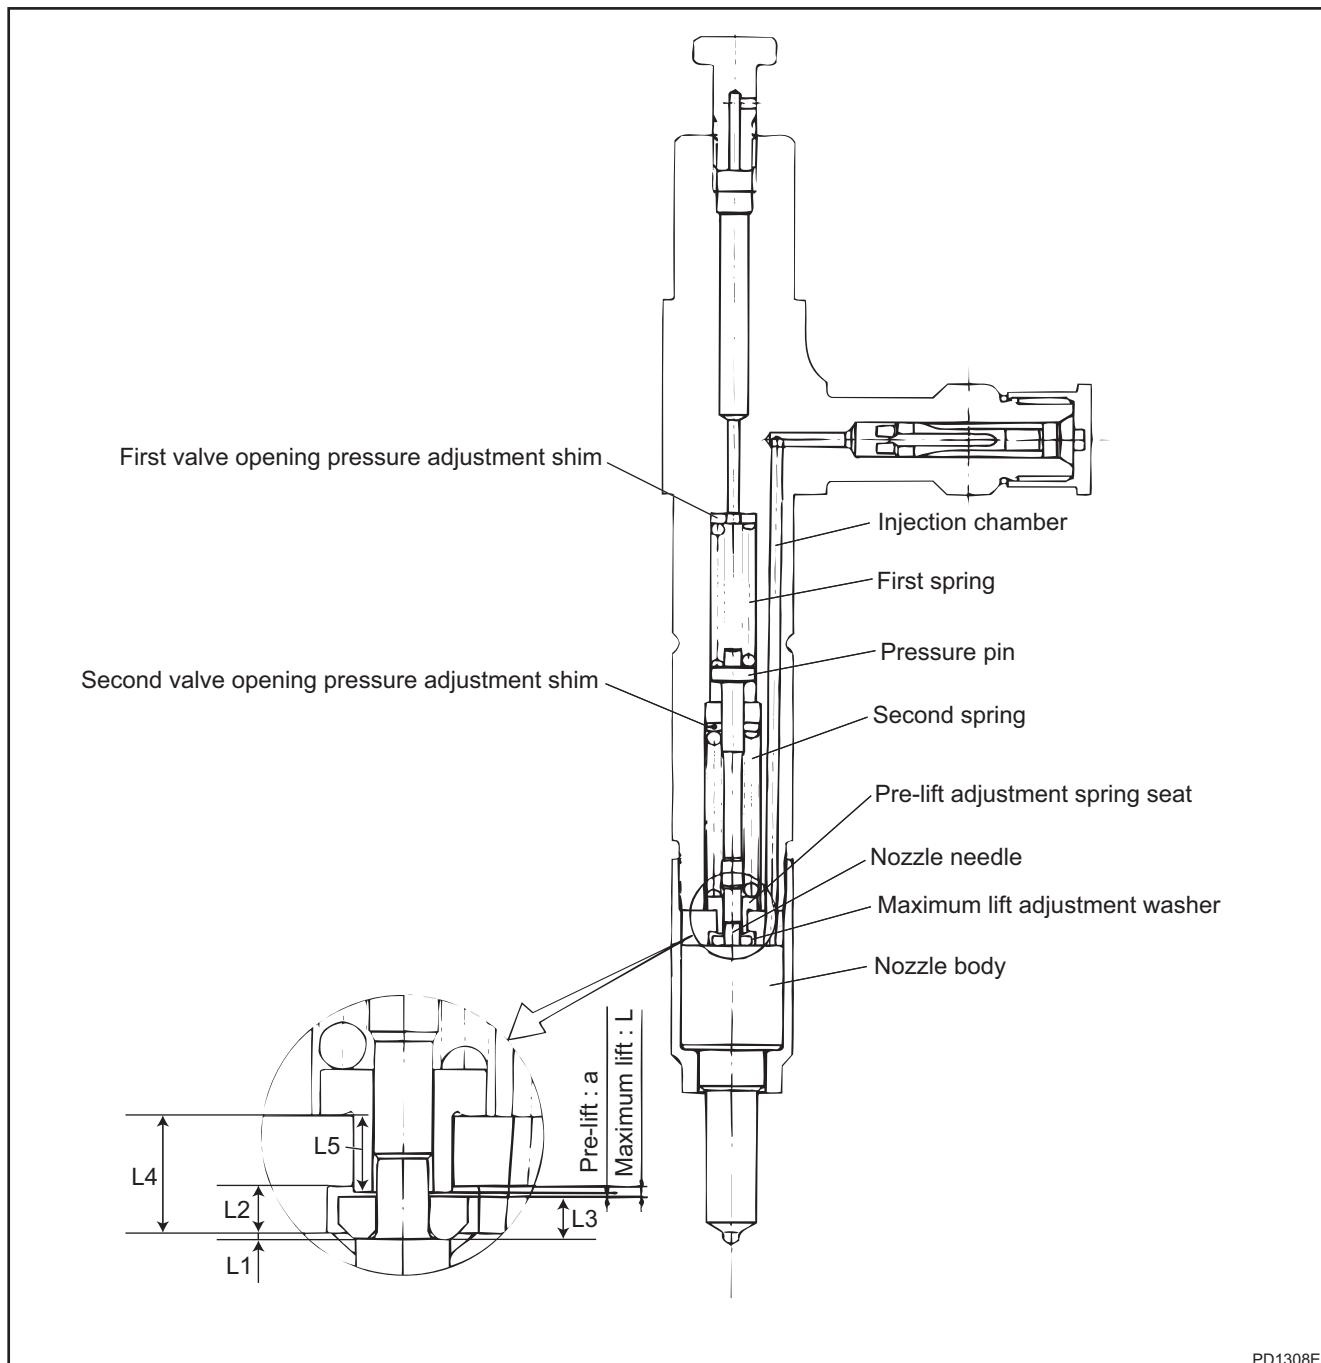

C) Adjustment 3

If the pressure deviates from the specified value, adjust it by changing the first valve opening pressure adjustment shim to one with a different thickness.

B. Type 2 (Reinforced Type)

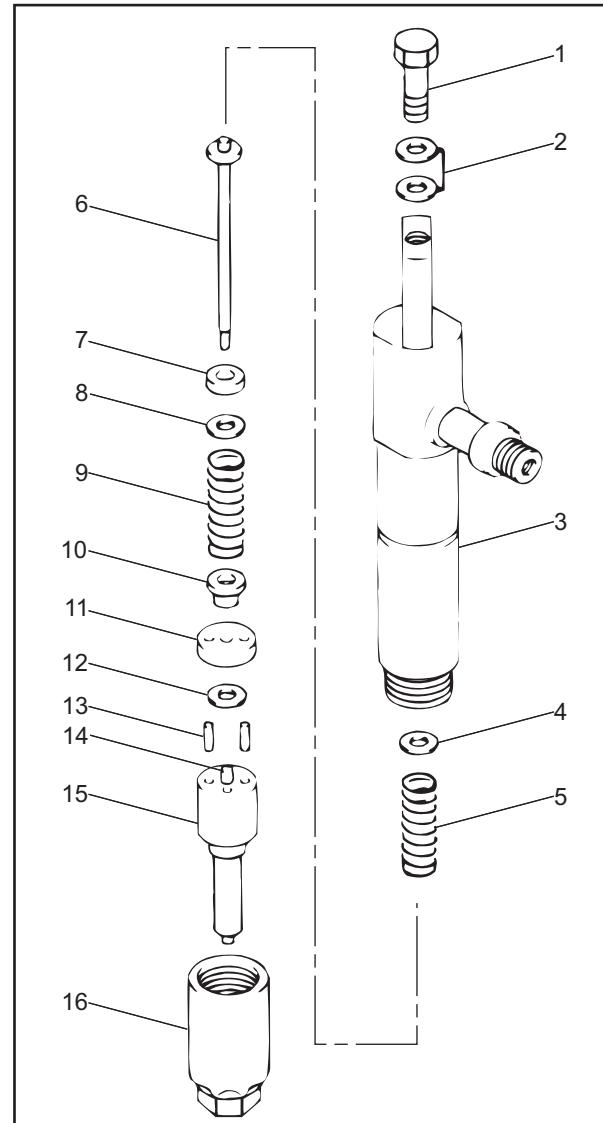

a. Construction Diagram

PD1308E

b. Constituent Parts and Names

No.	Name
1	Hollow screw
2	Washer
3	Nozzle holder body
4	First valve opening pressure adjustment shim
5	First spring
6	Pressure pin
7	Spring seat
8	Second valve opening pressure adjustment shim
9	Second spring
10	Pre-lift adjustment spring seat
11	Tip packing
12	Maximum lift adjustment washer
13	Straight pin
14	Nozzle needle
15	Nozzle
16	Retaining nut

PQ0064E

< NOTE >

- There are two types of nozzle needles as follows.

[Nozzle needle with protrusion]

[Nozzle needle without protrusion]

PD1309E

< CAUTION >

- A measurement of the dimension L1 of the nozzle needle without a protrusion will give a negative value. Therefore, make sure that you measure it correctly.

< NOTE >

- The method for calculating the amount of pre-lift of the type of nozzle needle without a protrusion is described below. For dimensions L1 to L5, refer to the construction diagram.

$$\left(\begin{array}{l} L1 = -0.1 \text{ mm} \\ L3 = 2.1 \text{ mm} \\ L4 = 5.0 \text{ mm} \\ L5 = 2.9 \text{ mm} \end{array} \right)$$

Hence, the pre-lift amount will be:

$$\begin{aligned} L4 - L5 - (L3 - L1) &= 5.0 - 2.9 - (2.1 - (-0.1)) \\ &= 5.0 - 2.9 - (2.1 + 0.1) \\ &= -0.1 = -0.1 \text{ mm} \end{aligned}$$

PD1310E

c. Adjustment Procedure (Summary)

Adjustment Sequence	1. Maximum Lift	2. Pre-lift	3. Second Valve Opening Pressure	4. First Valve Opening Pressure
Measurement Method	Measure the needle recession dimension L1, the tip packing groove depth L2, and the maximum lift adjustment washer thickness L3, in order to calculate the maximum lift ($L1 + L2$) - L3. * Dimension L1 may be a negative value.	Measure the tip packing thickness L4 and the spring seat leg length L5 in order to calculate the pre-lift: $L4 - L5 - (L3 - L1)$. * Dimension L1 may be a negative value.	Pull out the first valve opening pressure adjustment shim, the first spring, and the pressure pin. Replace the pre-lift adjustment spring seat with the master spring seat (STT) and measure the valve opening pressure.	Assemble all parts and measure the valve opening pressure.
Adjustment Method	Select a maximum lift adjustment washer.	Select a pre-lift adjustment spring seat.	Select a second valve opening pressure adjustment shim.	Select a first valve opening pressure adjustment shim.
Tools	2-spring base (STT: 95093-10230) Measure attachment (STT: 95093-10300) Dial gauge, Micrometer	Micrometer	Master spring seat (STT: 95093-10330) Nozzle hand tester	Nozzle hand tester

d. STT

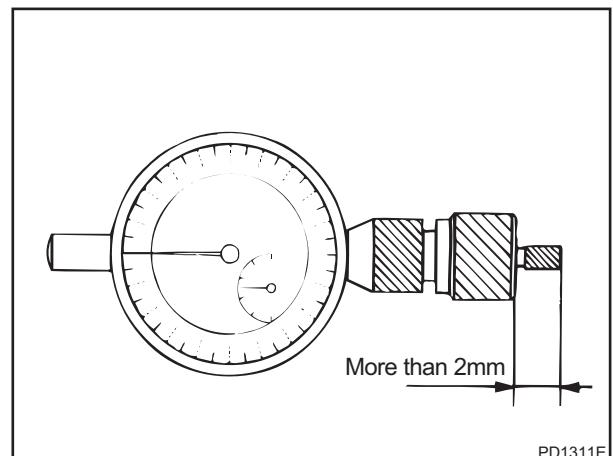

No.	Name	DENSO P/N	
1	Master spring seat	95093-10330	
2	2-spring base	95093-10230	
3	Measure attachment	95093-10300	
4	Dial gauge	95800-10050	
			<p>PQ0072E</p>

e. Detailed Adjustment Procedure

(1) Maximum lift adjustment

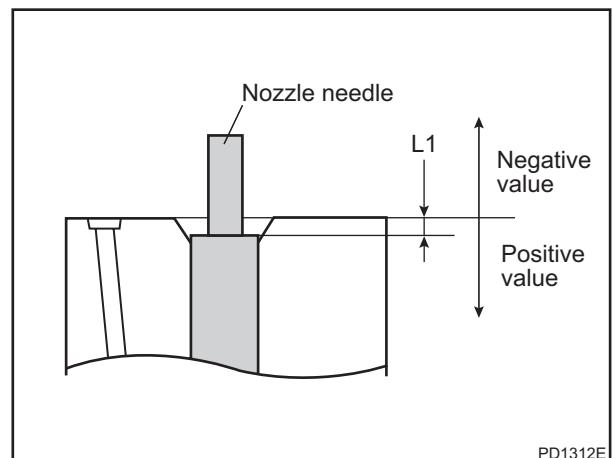

A) Adjustment 1

Attach the measure attachment (STT) to the dial gauge.

B) Adjustment 2 (nozzle needle with protrusion)

Measure dimension L1.

a) Measurement 1

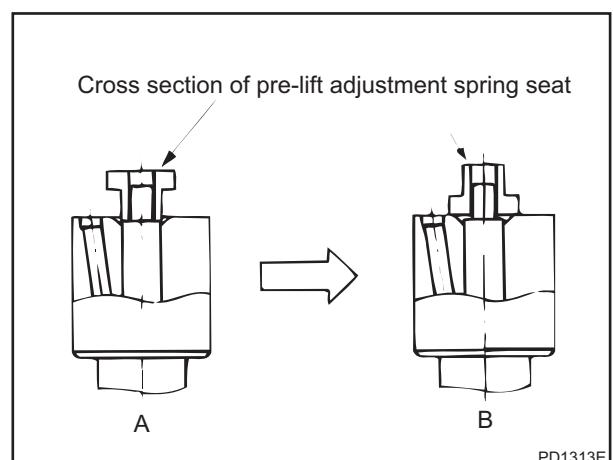

Place the nozzle on the 2-spring base (STT), and place the pre-lift adjustment spring seat as indicated by "A" in the diagram on the right.

b) Measurement 2

Align the hole of the measure attachment (STT) with the pre-lift adjustment spring seat and set the graduation on the dial gauge to zero.

c) Measurement 3

Place the pre-lift adjustment spring seat by facing it in the opposite direction ("B" in the diagram on the right). Align the hole of the measure attachment (STT) with the pre-lift adjustment spring seat and measure L1.

C) Adjustment 2' (nozzle needle without protrusion)

Measure dimension L1.

a) Measurement 1

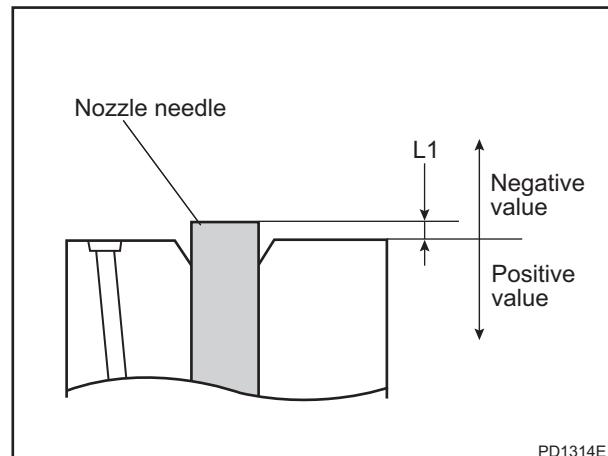

Place the dial gauge on the flat surface of the 2-spring base. Then, set the dial gauge graduation to zero.

b) Measurement 2

Place the dial gauge on the nozzle needle to measure dimension L1.

< NOTE >

- At this time, dimension L1 will result in a negative value.

D) Adjustment 3

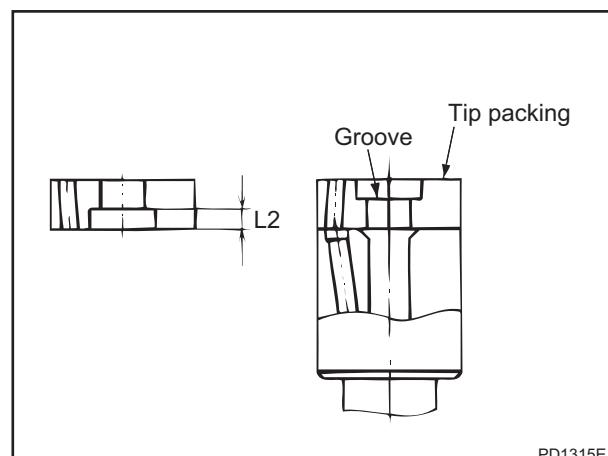

Place the nozzle body (nozzle needle removed) on the 2-spring base (STT) and place the tip packing (groove facing up) as shown in the diagram on the right.

E) Adjustment 4

On the 2-spring base (STT), set the graduation of the dial gauge to zero.

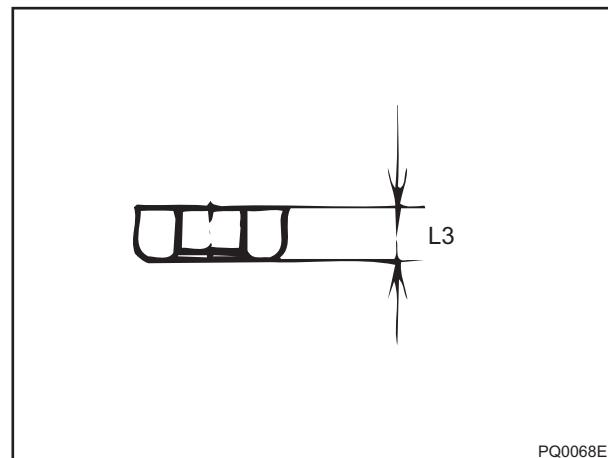

F) Adjustment 5

Place the needle of the dial gauge so that it comes in contact with the groove of the tip packing and measure L2.

G) Adjustment 6

Using a micrometer, measure the thickness L3 of the maximum lift adjustment washer.

H) Adjustment 7

Calculate the maximum lift according to the measured L1, L2, and L3.

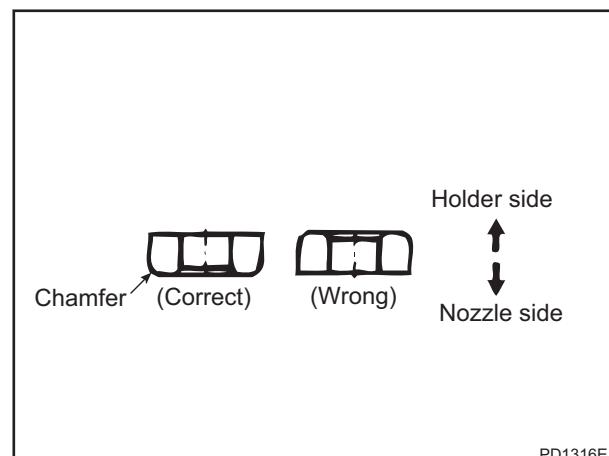

- Specified value: $(L1 + L2) - L3$

I) Adjustment 8

If the amount of maximum lift deviates from the specified value, adjust it by changing the maximum lift adjustment washer to one with a different thickness.

< CAUTION >

- Make sure to install the maximum lift adjustment washer correctly (chamfer facing the nozzle), as it could lead to damage or other problems if it is installed upside down.

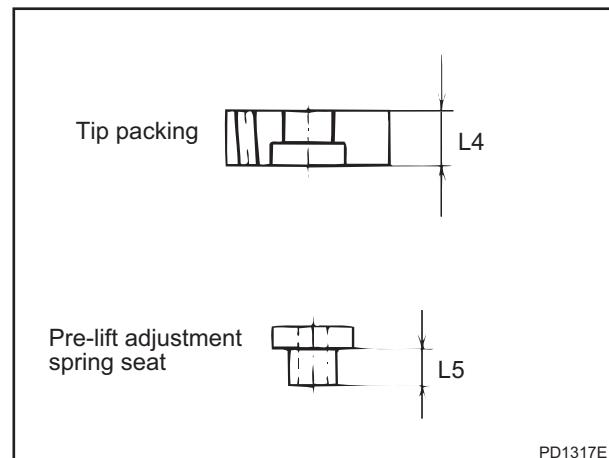

PD1316E

(2) Pre-lift adjustment

A) Adjustment 1

Using a micrometer, measure the thickness L4 of the tip packing.

PD1317E

B) Adjustment 2

Using a micrometer, measure the length L5 of the leg of the pre-lift adjustment spring seat.

C) Adjustment 3

Calculate the amount of pre-lift according to the measured L1, L3, L4, and L5.

- Specified value: $L4 - L5 - (L3 - L1)$

D) Adjustment 4

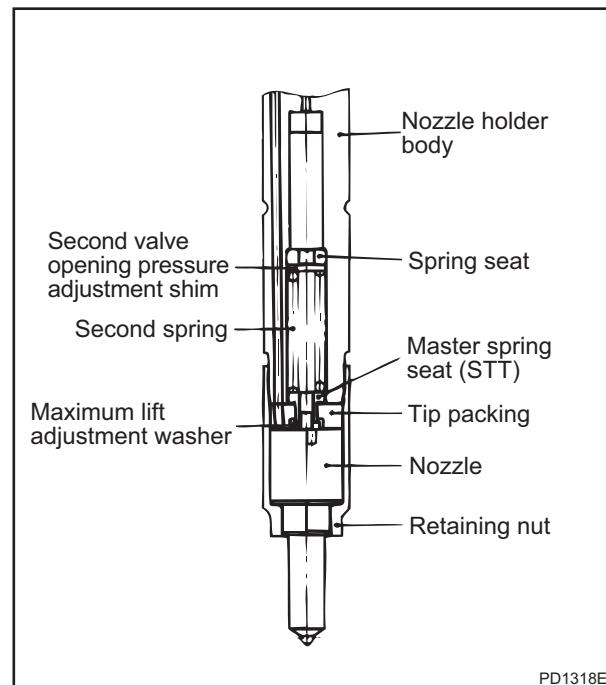

If the amount of pre-lift deviates from the specified value, adjust it by changing the pre-lift adjustment spring seat to one with a different thickness.

(3) Second valve opening pressure adjustment

A) Adjustment 1

In the nozzle holder body, install the spring seat, the second valve opening pressure adjustment shim, the second spring, master spring seat (STT), the straight pin, the tip packing, the maximum lift adjustment washer, and the nozzle. Then, tighten the retaining nut.

- Tightening torque: 24.5 - 34.3N·m (2.5 - 3.5kgf·m)

PD1318E

B) Adjustment 2

On the nozzle hand tester, install the nozzle and nozzle holder that were assembled in step "Adjustment 1", and measure the second valve opening pressure.

- Second valve opening pressure: 23.1 - 24.0MPa (235 - 245kgf/cm²)

< NOTE >

- For production number '97/9 and thereafter, the second valve opening pressure has been changed in accordance with the change in the shape of the part. Therefore, refer to "1-8. Reference Material" at the end of the manual for the specified value.

C) Adjustment 3

If the pressure deviates from the specified value, adjust it by changing the second valve opening pressure adjustment shim to one with a different thickness.

< NOTE >

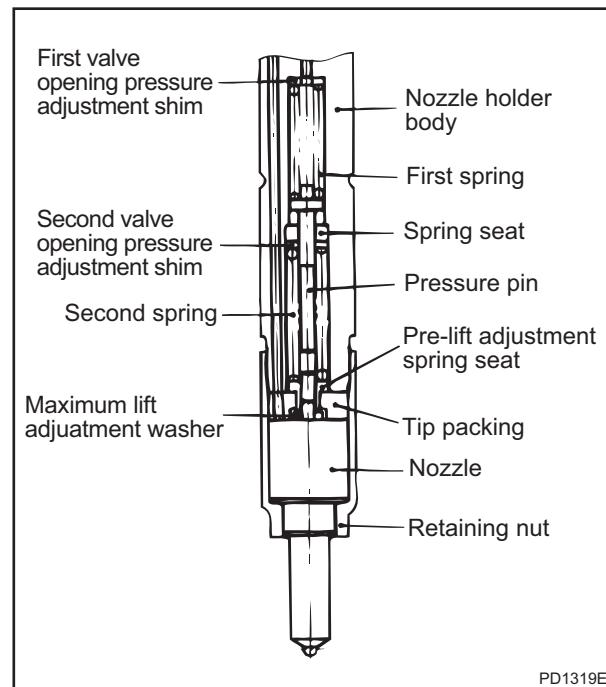

- Using a shim that is thicker by 0.05mm increases the valve opening pressure by approximately 0.7MPa (7.6kgf/cm²).

(4) First valve opening pressure adjustment

A) Adjustment 1

In the nozzle holder body, install the first valve opening pressure adjustment shim, first spring, pressure pin, spring seat, second valve opening pressure adjustment shim, second spring, pre-lift adjustment spring seat, straight pin, tip packing, nozzle maximum lift adjustment washer, and the nozzle. Then, tighten the retaining nut.

- Tightening torque: 24.5 - 34.3N·m (2.5 - 3.5kgf·m)

PD1319E

B) Adjustment 2

Attach onto the nozzle hand tester the nozzle and the nozzle holder that were installed in step "Adjustment 1", and measure the first valve opening pressure.

- First valve opening pressure: 17.7 - 18.6MPa (180 - 190kgf/cm²)

C) Adjustment 3

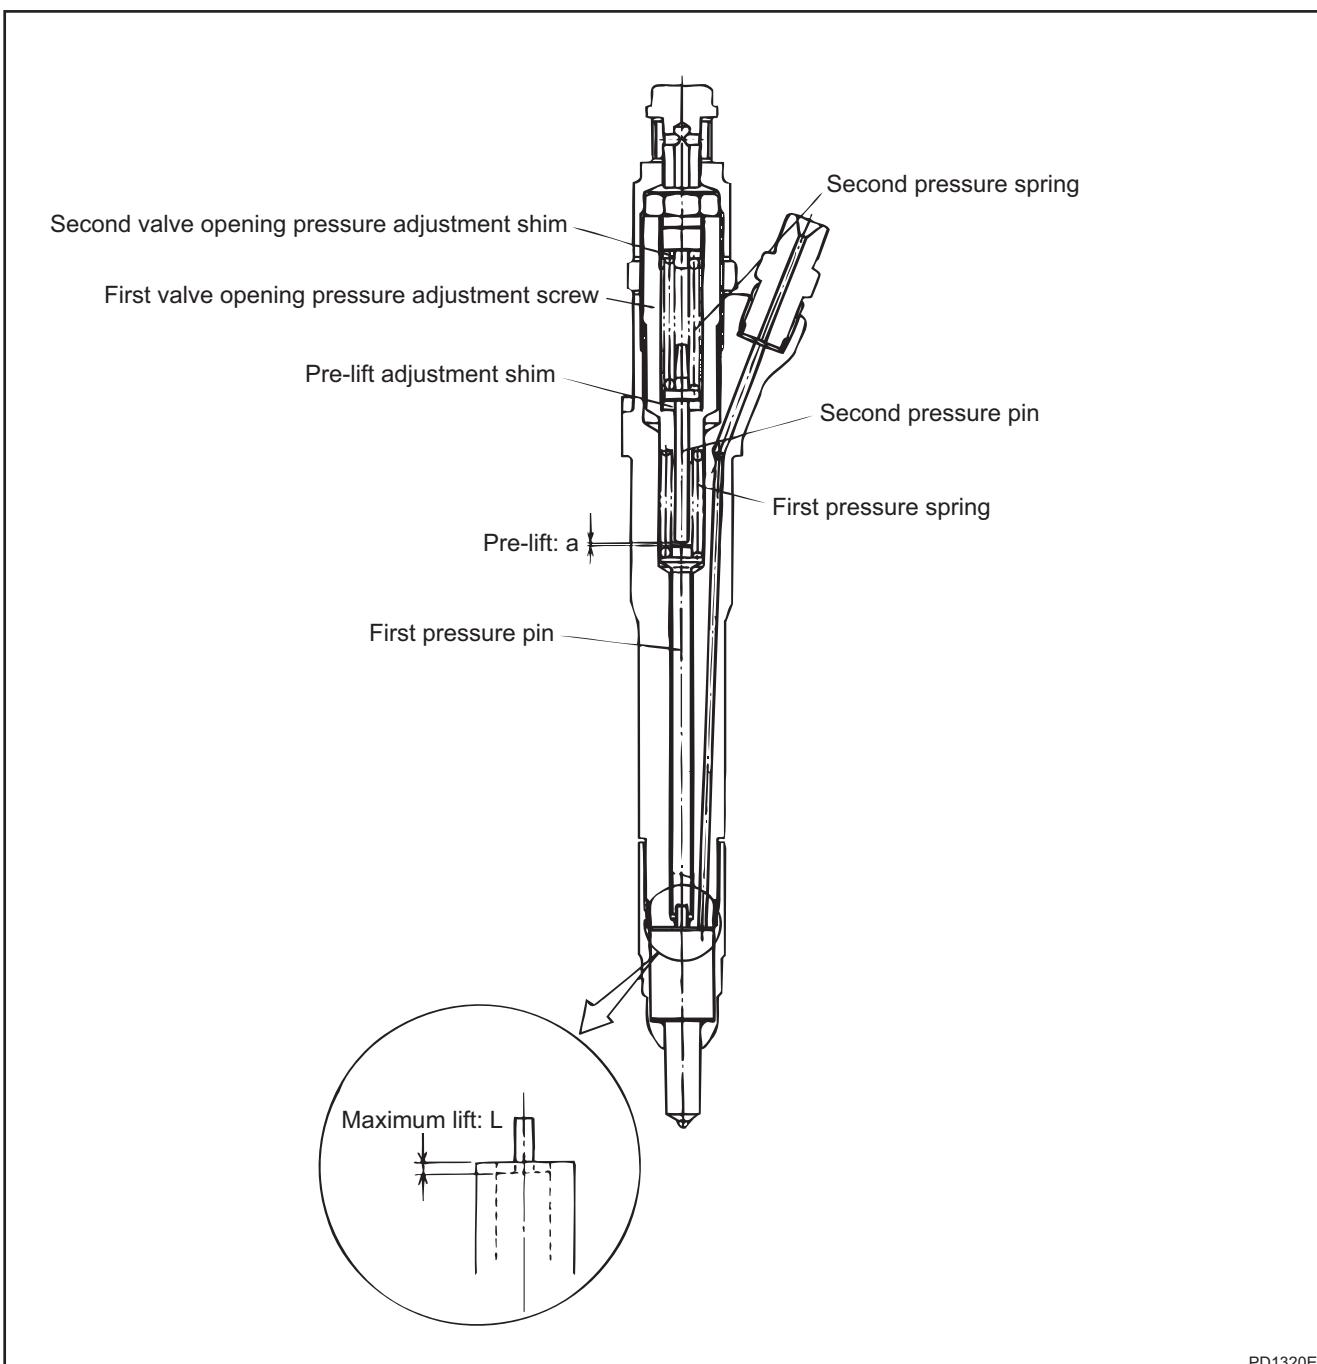

If the pressure deviates from the specified value, adjust it by changing the first valve opening pressure adjustment shim to one with a different thickness.

< NOTE >

- Using a shim that is thicker by 0.05mm increases the valve opening pressure by approximately 0.7MPa (7.6kgf/cm²).

d. STT

No.	Part Name	DENSO P/N	
1	2-spring nozzle adjustment tool	95091-10770	
2	Dial gauge	95800-10050	 QT0358E

e. Detailed Adjustment Procedure (For 093500-3090 as an example)

(1) First valve opening pressure adjustment

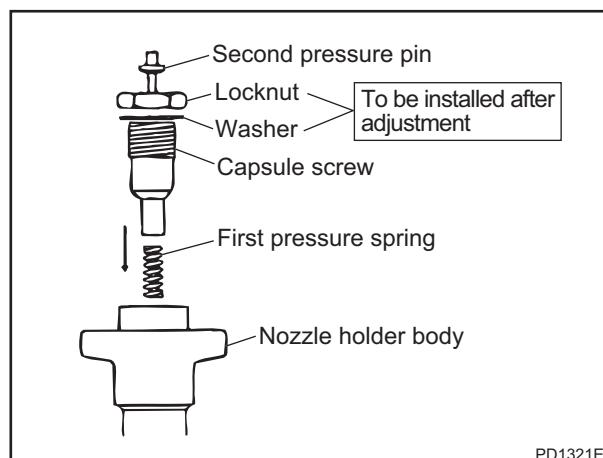

A) Adjustment 1

Assemble the nozzle and the first pressure pin on the nozzle holder and tighten them with the retaining nut.

- Tightening torque: 58.8 - 78.5N·m (6.0 - 8.0kgf·m)

B) Adjustment 2

Insert the first pressure spring and install the capsule screw.

C) Adjustment 3

Place it on the nozzle hand tester, and regulate the amount in which to screw in the capsule screw in order to adjust the first valve opening pressure.

- First valve opening pressure:
17.7 - 18.6MPa (180 - 190kgf/cm²)

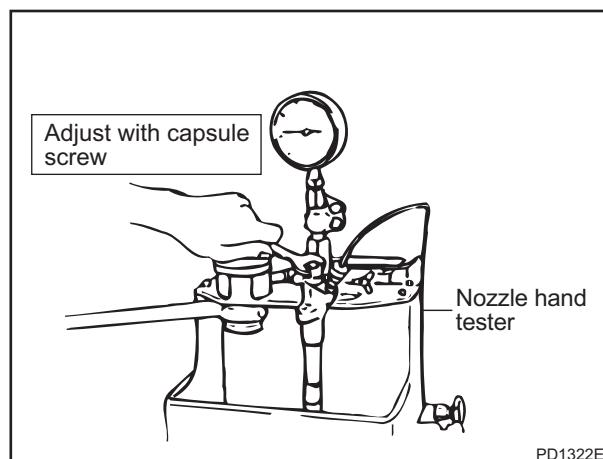

< NOTE >

- Screwing in the capsule screw increases the first valve opening pressure.

D) Adjustment 4

Tighten the locknut to secure the capsule screw in place.

- Tightening torque: 58.8 - 68.6N·m (6.0 - 7.0kgf·m)

(2) Second valve opening pressure adjustment

A) Adjustment 1

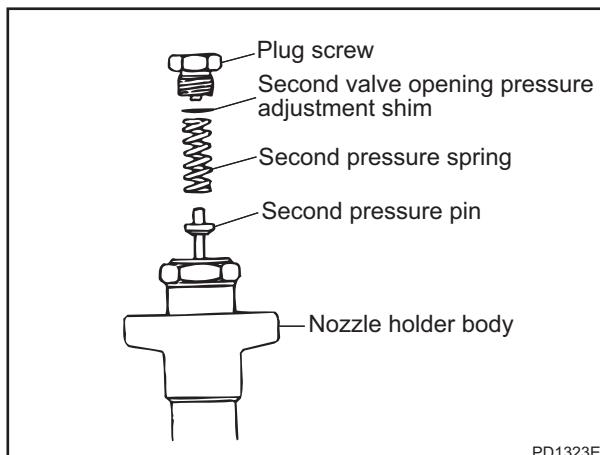

Assemble the second pressure pin, second pressure spring, and the second valve opening pressure adjustment shim. Then, tighten the plug screw until it comes in contact with the capsule screw.

< CAUTION >

- At this time, do not install the pre-lift adjustment shim.

< NOTE >

- At this time, a set load is applied to the second pressure spring, which pushes the second pressure pin downward. Because no pre-lift adjustment shim is installed, the amount of pre-lift is zero.

PD1323E

< NOTE >

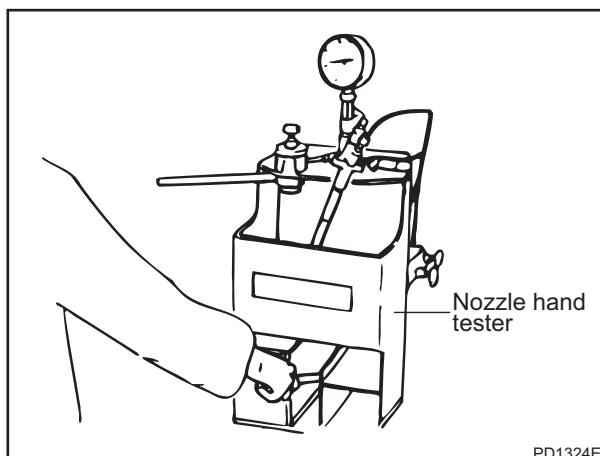

- If the thickness of the second valve opening pressure adjustment shim that was installed is unknown, use 1.9mm as a nominal value.

B) Adjustment 2

Place it on the nozzle hand tester and measure the second valve opening pressure.

- Second valve opening pressure:

24.9 - 25.7MPa (254 - 262kgf/cm²)

PD1324E

C) Adjustment 3

If the pressure deviates from the specified value, adjust it by changing the second valve opening pressure adjustment shim to one with a different thickness.

< NOTE >

- Although the relationship between shim thickness and valve opening pressure differs from product to product, the pressure changes approximately 0.1MPa (1.1 kgf/cm²) for every 0.01mm of shim thickness.

(3) Pre-lift adjustment

A) Adjustment 1

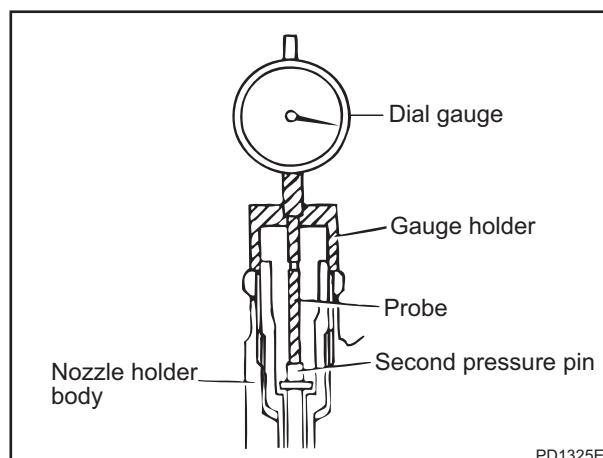

Remove the plug screw, second valve opening pressure adjustment shim, and the second pressure spring.

B) Adjustment 2

Place the dial gauge, probe, and the gauge holder on the nozzle holder.

C) Adjustment 3

Set the dial gauge graduation to zero (repeat this process two or three times).

D) Adjustment 4

Remove the second pressure pin and install the pre-lift adjustment shim.

E) Adjustment 5

Re-install the second pressure pin.

F) Adjustment 6

Similar to step "Adjustment 3", place the dial gauge and measure the amount of pre-lift.

- Pre-lift: 0.08 - 0.12mm

< NOTE >

- Because the pressure pins are in contact at this time, the second pressure pin will be slightly lifted. When a pre-lift adjustment shim is inserted in this state, the second pressure pin will move upward only in the amount of the pre-lift.

< NOTE >

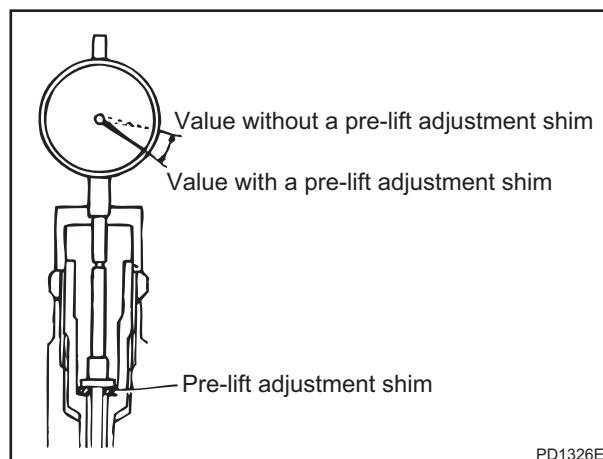

- If the thickness of the pre-lift adjustment shim that was installed is unknown, use 1.1mm as a nominal value.

G) Adjustment 7

If the amount of pre-lift deviates from the specified value, adjust it by changing the pre-lift adjustment shim to one with a different thickness.

< NOTE >

- If the amount of pre-lift is greater than the specified value, use a thinner shim. If it is smaller than the specified value, use a thicker shim.

(4) First valve opening pressure verification

A) Verification 1

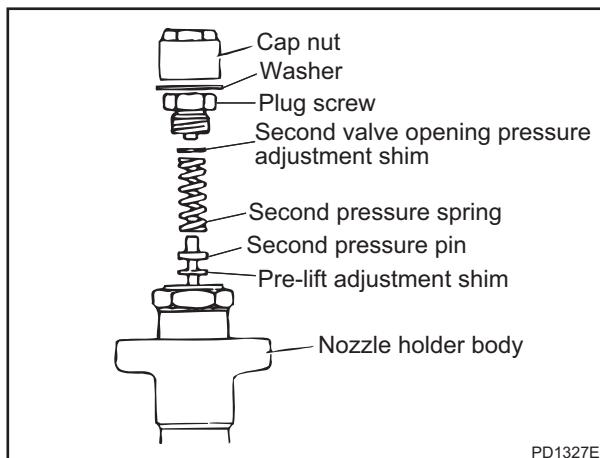

Install the pre-lift adjustment shim, the second pressure pin, the second pressure spring, and the second valve opening pressure adjustment shim; then, tighten the plug screw.

- Tightening torque: 29.4 - 39.2N·m (3.0 - 4.0kgf·m)

B) Verification 2

Using a washer in between, install the cap nut.

- Tightening torque: 39.2 - 49.0N·m (4.0 - 5.0kgf·m)

< CAUTION >

- Make sure to use a pre-lift adjustment shim and a second valve opening pressure adjustment shim as determined in the previously mentioned adjustment process.

< CAUTION >

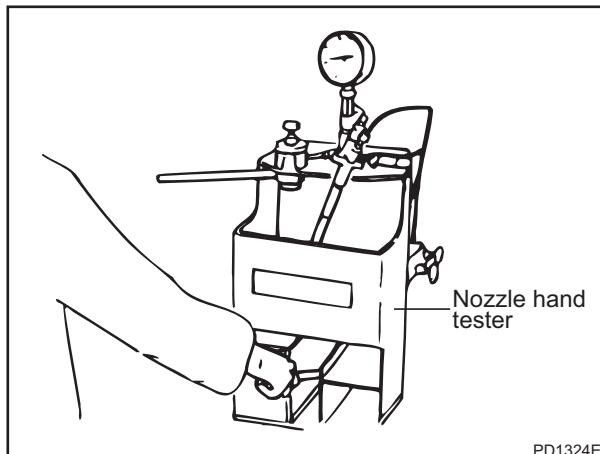

- Be careful in distinguishing a pre-lift adjustment shim and a second valve opening pressure adjustment shim, as both have the same size and shape.

C) Verification 3

Place the nozzle on the nozzle hand tester and verify that the first valve opening pressure has the following value:

- First valve opening pressure:

17.7 - 18.4MPa (180 - 188kgf/cm²)

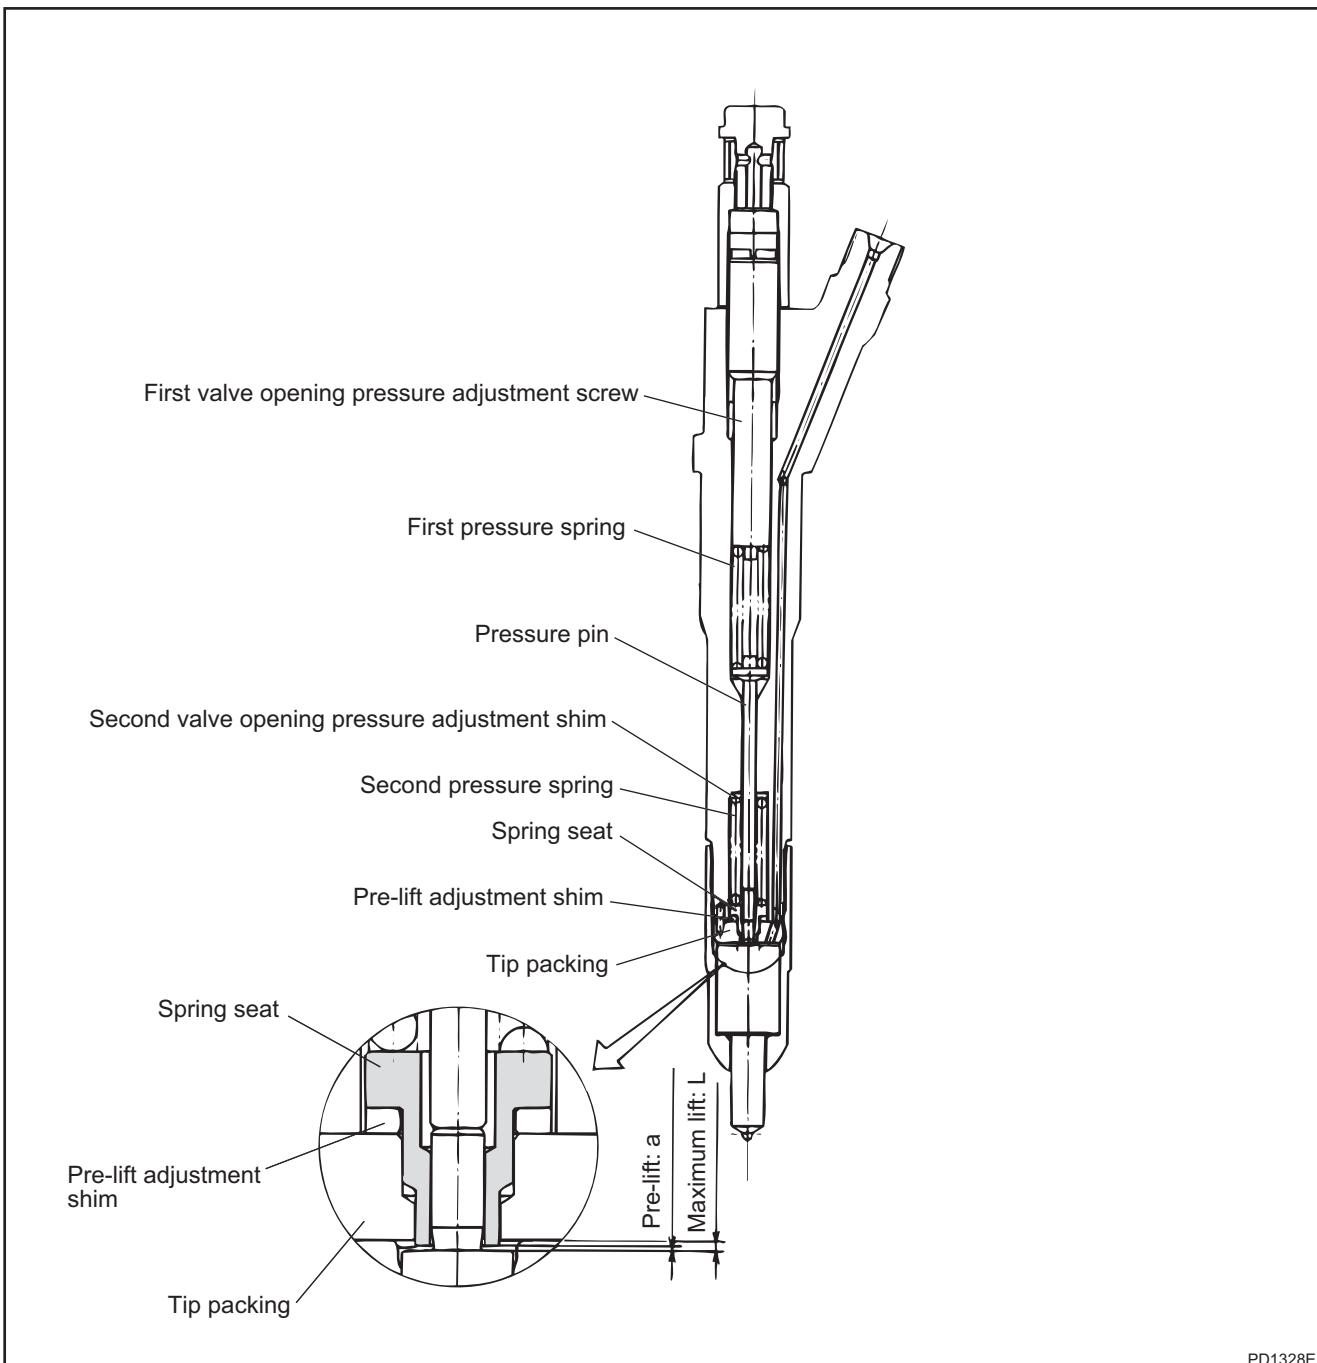

< CAUTION >

- If the pressure deviates from the specified value, repeat the adjustment process from the beginning.

Adjustment Sequence	1. Pre-lift	2. First Valve Opening Pressure	3. Second Valve Opening Pressure	4. First Valve Opening Pressure
Measurement Method	Measure the amount of deflection of the dial gauge with the pre-lift adjustment shim removed and installed.	Pull out the pre-lift adjustment shim, the second valve opening pressure adjustment shim, the spring seat, and the second pressure spring; then, measure the valve opening pressure.	Pull out the pre-lift adjustment shim and measure the valve opening pressure.	Install all parts and measure (verify) the valve opening pressure.
Adjustment Method	Select a pre-lift adjustment shim.	Adjust with the first valve opening pressure adjustment screw.	Select a second valve opening pressure adjustment shim.	–
Tools	2-spring base (STT: 95093-10230) Base (STT: 95093-20180) Dial gauge holder unit (STT: 95800-20010) Probe joint (STT: 95800-20020) Probe (STT: 95800-20030) Socket wrench (STT: 95991-10150) Dial gauge	Nozzle hand tester	Nozzle hand tester	Nozzle hand tester

d. STT

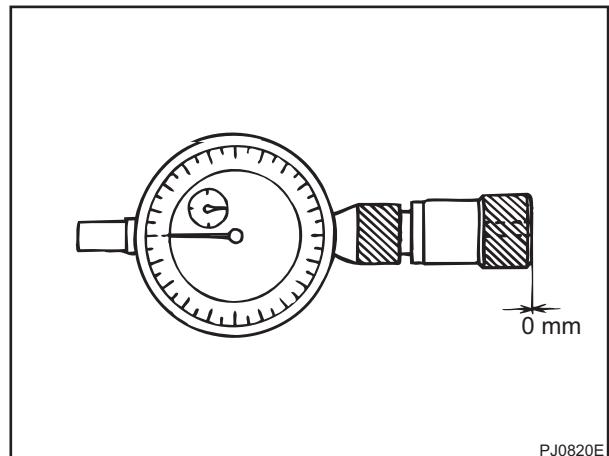

No.	Part Name	DENSO P/N	
1	2-spring base	95093-10230	
2	Base	95093-20180	
3	Dial gauge holder unit	95800-20010	
4	Probe joint	95800-20020	
5	Probe	95800-20030	
6	Socket wrench	95991-10150	
			 PJ0818E

e. Detailed Adjustment Procedure (For 093500-4880 as an example)

(1) Pre-lift adjustment

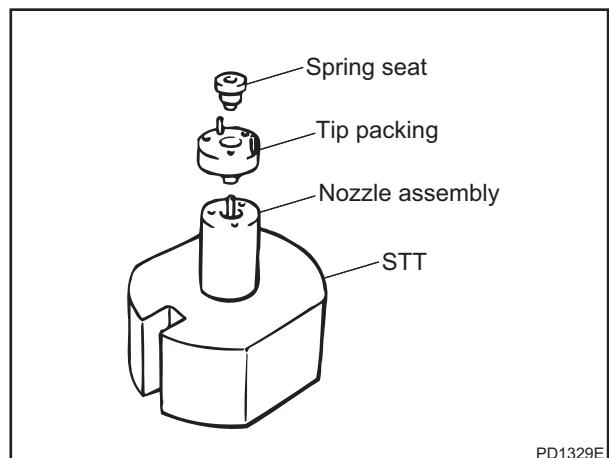

A) Adjustment 1

Render the distance between the probe and the end of the STT to be approximately 0mm; then install the STT on the dial gauge.

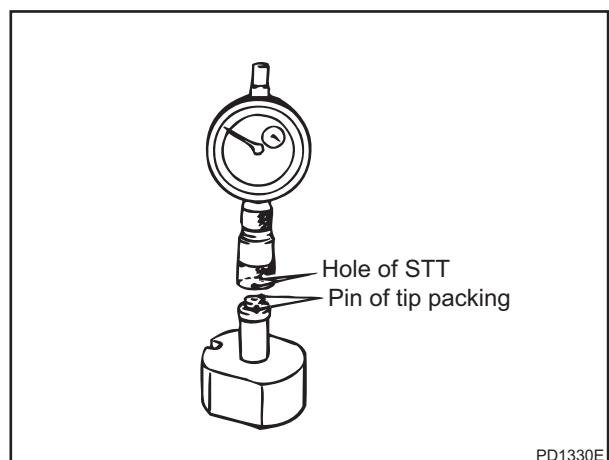

B) Adjustment 2

Install the nozzle assembly, the tip packing, and the spring seat on the STT.

C) Adjustment 3

Align the hole of the STT with the pin of the tip packing and set the dial gauge graduation to zero.

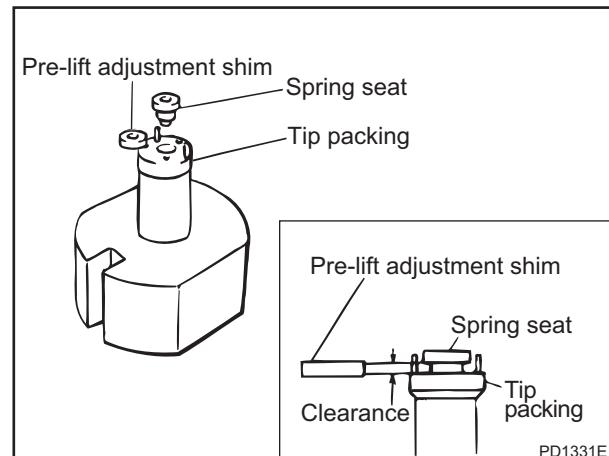

D) Adjustment 4

Select a pre-lift adjustment shim that is thicker than the clearance between the tip packing and the spring seat. Then install the shim between the tip packing and the spring seat.

< NOTE >

- Select and install a pre-lift adjustment shim with a nominal value of 1.5mm.

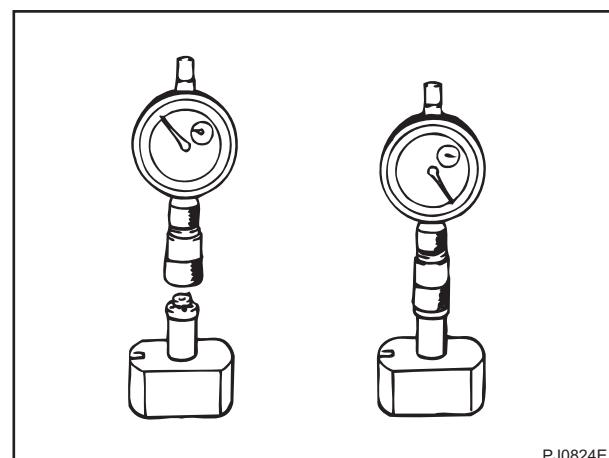

E) Adjustment 5

Using a dial gauge, measure the amount of pre-lift. Then, replace the pre-lift adjustment shim with one of a different thickness in order to attain the specified value indicated below.

- Specified value: $0.095 \pm 0.015\text{mm}$

< NOTE >

- Using a thicker pre-lift adjustment shim increases the amount of pre-lift.

< CAUTION >

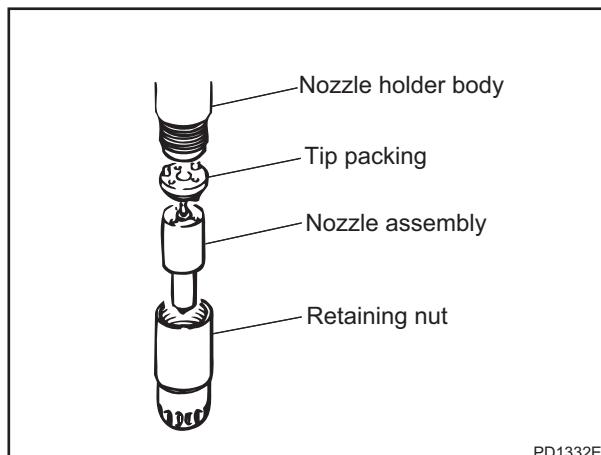

- Because adjusting the pre-lift requires high precision, thoroughly clean the parts and make sure that they are free of foreign objects before performing the operation.

(2) First valve opening pressure adjustment

A) Adjustment 1

Install the nozzle assembly and the tip packing in the nozzle holder body. Using the STT, tighten the retaining nut.

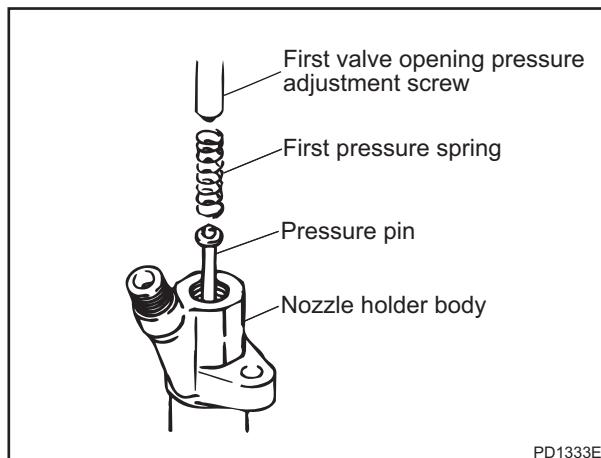

- Tightening torque: 58.8 - 78.5N.m (6.0 - 8.0kgf.m)

PD1332E

B) Adjustment 2

Insert the pressure pin into the nozzle holder body. Then, insert the first pressure spring, install the first valve opening pressure adjustment screw, and tighten it until it comes in contact with the first pressure spring.

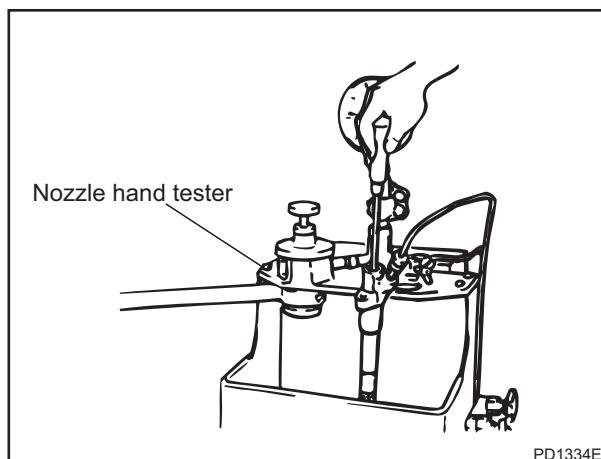

PD1333E

C) Adjustment 3

Place it on the nozzle hand tester, and regulate the amount in which to screw in the first valve opening pressure adjustment screw in order to adjust the first valve opening pressure.

- First valve opening pressure:

14.7 - 15.5MPa (150 - 158kgf/cm²)

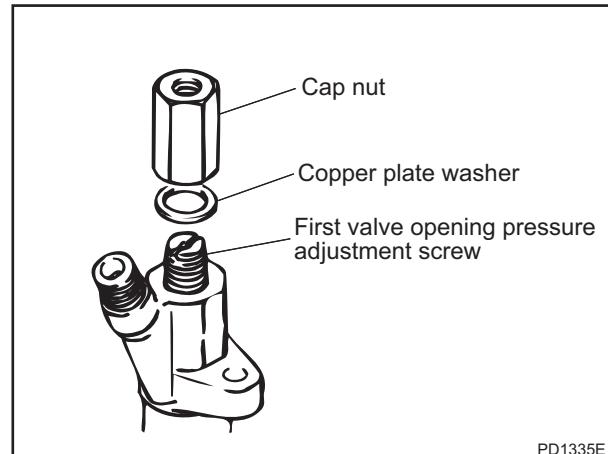

PD1334E

D) Adjustment 4

Using the copper plate washer and the cap nut, secure the first valve opening pressure adjustment screw in place.

- Tightening torque: 39.2 - 49.0N·m (4.0 - 5.0kgf·m)

PD1335E

(3) Second valve opening pressure adjustment

A) Adjustment 1

In the nozzle holder body, install the second valve opening pressure adjustment shim, the second pressure spring, the spring seat, the tip packing, and the nozzle assembly. Then, use the STT to tighten the retaining nut.

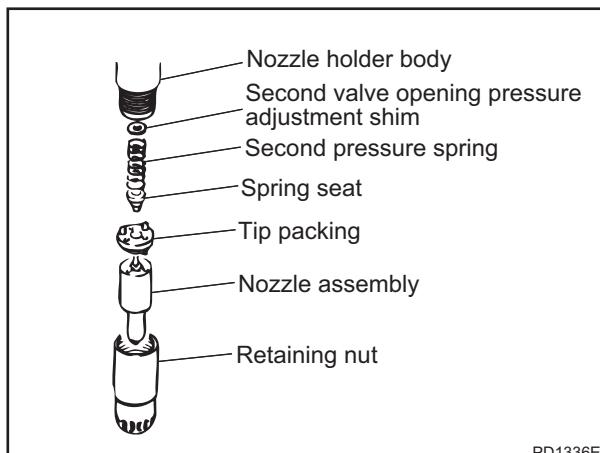

- Tightening torque: 58.8 - 78.5N.m (6.0 - 8.0kgf.m)

< CAUTION >

- Do not install the pre-lift adjustment shim.

< NOTE >

- If the thickness of the second valve opening pressure adjustment shim that was installed is unknown, use 1.4mm as a nominal value.

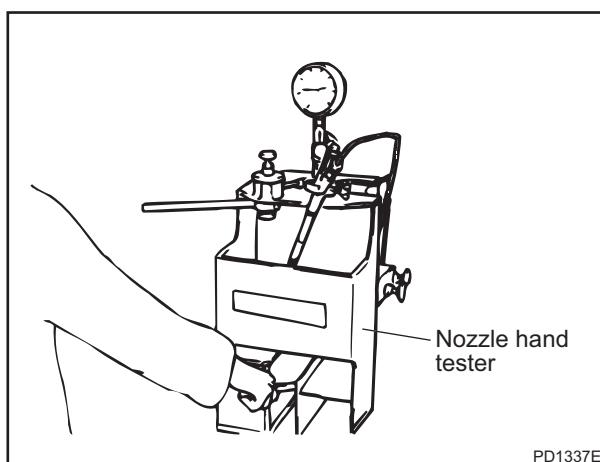

PD1336E

B) Adjustment 2

Place it on the nozzle hand tester and measure the second valve opening pressure.

- Second valve opening pressure:

27.6 - 28.3MPa (281 - 289kgf/cm²)

PD1337E

C) Adjustment 3

If the pressure deviates from the specified value, adjust it by changing the second valve opening pressure adjustment shim to one with a different thickness.

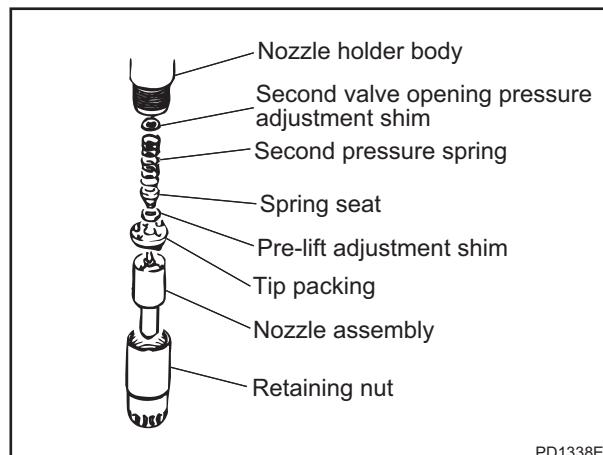

< NOTE >

- Although the relationship between shim thickness and valve opening pressure differs from product to product, the pressure changes approximately 0.1MPa (0.9 kgf/cm²) for every 0.01mm of shim thickness.

(4) First valve opening pressure verification

A) Verification 1

Install the pre-lift adjustment shim that was used in the adjustment in section (1).

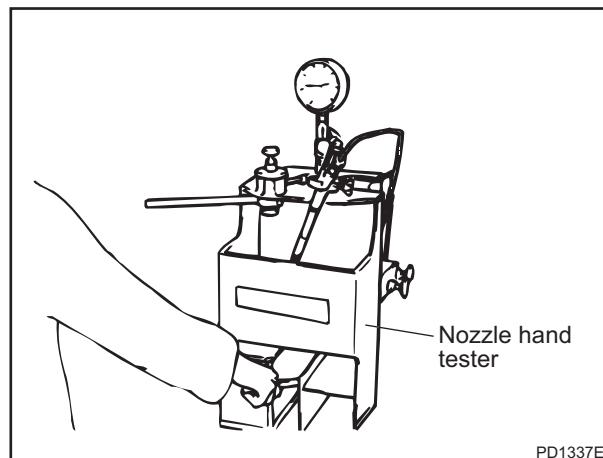

B) Verification 2

Place it on the nozzle hand tester and verify that the first valve opening pressure has the value indicated below.

- First valve opening pressure:

14.7 - 15.5MPa (150 - 158kgf/cm²)

1-8. Reference Material (Reference only. The latest data is updated on ETSI.)

A. List of Adjustment Values

Nozzle & Nozzle Holder P/N	Nozzle Holder Type	Nozzle P/N	First Valve Opening Pressure MPa [kgf/cm ²]	Second Valve Opening Pressure MPa [kgf/cm ²]	Pre-lift (mm)	Maximum Lift (mm)	Type
